New phosphatase and kinase enzyme(s) - useful in the diagnosis and treatment of signal transduction disorders.

Claim 11; Fig 3a-d; 138pp; English.

This polypeptide comprises a novel human protein tyrosine phosphatase (PTP), designated brain derived phosphatase 1 (BDP-1), that its expressed in most tissues and cell lines at basal level, but expressed high in epithelium origin cell lines and cancer cell lines. The amino acid sequence was deduced from a cDNA clone (see AAV17099) isolated from a hamaropoietic MEGOL CDNA library. The invention relates to novel proteins (see AAW49906-14) involved in cellular signal transduction and to the nucleic acids (see AAV17097-99) coding for them, and provides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             151
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        211
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated polypeptide which is a human kinase and phosphatase (KPP). The KPP polypeptides, polynucleotides, pagnists and antagonists are useful for diagnosing, treating or preventing cell proliferative disorders such as atherosclerosis, cirrhosis, hepatitis and cancer, developmental disorders e.g. mental Parkinson's disease and isorders including Alzheimer's disease and Parkinson's disease and diabetes mellitus and finally, viral, bacterial, fungal, parasitic, protozoan or helmitchic infections. Furthermore, the polynucleotides encoding KPP may be useful for creating transgenic animals to model human disease, as well as during gene therapy procedures. The current sequence is that of the human KPP protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   91

                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a partial human non-receptor protein
tyrosine phosphatase of hematopoietic stem cells (PTP HGC). This protein
tyrosine phosphatase din early hematopoietic stem cells (HSGS) or
progenitor cells, and lacks expression in adult tissues. The protein has
a N-terminal tyrosine phosphatase domain, followed by a region rich in
serine, threonine and proline and a C-terminal region of about 15.25
amino acids which is rich in basic amino acid residues. The protein is
capable of tyrosine dephosphorylation in hematopoietic progenitor cells,
and functional derivatives of such matic tyrosine phosphatase. The
phosphatase domain of the PTP HGC or a PTP HGC-expressing HGC or
progenitor cell can be used in an assay for the identification of PTP HGC
antagonists or agonists. The antagonist can be used to induce the
differentiation of stem cells, such as undifferentiated malignant
hematopoietic cells, e.g. leukaemia cells, which may facilitate their
treatment. The PTP HGC or an agonist antibody against the PTP HGC can be
can agonist on fundifferentiated stem cells in cell culture
(this allows expansion of undifferentiated stem cells in cell culture

The present sequence represents a novel murine non-receptor protein
tyrosine phosphatase of hematopoietic stem cells (PTP HSC). This protein
is predominantly expressed in early hematopoietic stem cells (HSCs) or
progenitor cells, and lacks expression in adult tissues. The protein has
a N-terminal tyrosine phosphatase domain, followed by a region rich in
serine, threonine and prolline and a C-terminal region of about 15-25
amino acids which is rich in basic amino acid residues. The protein is
capable of tyrosine dephosphorylation in hematopoietic progenitor cells,
and functional derivatives of such native tyrosine phosphatases. The
phosphatase domain of the PTP HSC or a PTP HSC-expressing HSC or
progenitor cell can be used in an assay for the identification of PTP HSC
antagonists or agonists. The antagonist can be used to induce the
differentiation of stem cells, such as undifferentiated malignant
hematopoietic cells, e.g. leukaemia cells, which may facilitate their
the PTP HSC or an agonist em cells in cell culture
the allows expansion of undifferentiated stem cells in cell culture
(this allows expansion of HSC prior to autologous or heterologous bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This polypeptide comprises a novel rat protein tyrosine phosphatase, designated PTP20, that regulates growth factor stimulation of cellular differentiation. Its amino acid sequence was deduced from a cDNA clone (see AAV17097) isolated from a rat phaecohromocytoma PCI2 cDNA library by PCR amplification using primers based on consensus sequences (see AAW190915-16) of known PTPs. The invention relates to novel proteins (see AAW19096-14) involved in Cellular signal transduction and to the nucleic acids (see AAV17097-99) coding for them, and provides vectors, host calls, purified recombinant proteins, methods for identifying compounds cativate or inhibit the novel proteins, well as methods for the diagnosis and treatment of diseases associated with the novel proteins. For PTP20, activators may act as anti-cancer therapeutic final section of useful for treatment injuries by delaying the differentiation of transplanted neuronal stem cells until they are firmly grafted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

The present sequence represents a peptide from the present invention which describes murine tyrosine phosphorylated cleavage furrow-sacotated protein (BSTPIP), which is a PSST-type protein tyrosine phosphatase (PTP)-interacting polypeptide. PSTPIP induces the polymerisation of actin monomers in a eukaryotic cell, by introducing a vector containing the nucleic acid sequence encoding PSTPIP into the cell. Assays for identifying (ant) agonists of PSTPIP comprise contacting PSTPIP with the agent and monitoring the ability of PSTPIP contacting actin polymerisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                            New PEST-type protein tyrosine phosphatase interacting polypeptide nucleic acids and vectors, for inducing the polymerisation of actin monomers in eukaryotic cells and identifying antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                          This sequence represents a fragment of a protein tyrosine phosphatase (PTP). It was used to isolate the PST phosphatase interacting protein (PSTPIP) sequence of the invention. The protein is a protin tyrosine phosphatase that possesses a non-catalytic domain comprising a proline, serine and threonine rich region and a C-terminal segment of 20 amino acid (as's) rich in proline, and defines an SH3 binding domain. Nucleic acids encoding native PSTPIP molecules can be used to isolate homologous specifically expressed in tumour cells, which might provide more specific targets for tumour therapy. The DNA is also useful for the preparation of PSTPIP polypeptides by recombinant techniques and as hybridisation probes for searching cDNA and genomic libraries for the coding sequence of other PSTPIP polypeptide analogues in other species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein tyrosine phosphatase; PTP; phosphatase interacting protein; PSTPIP; PEST family; protein tyrosine phosphatase; actin monomer; tissue typing; tumour cell; tumour imaging.
                                                                                                                                                            Novel genes encoding protein tyrosine phosphatase binding proteins for isolating homologous genes, e.g. in tumor cells, which provide specific targets for tumor therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

Treferred to as open reading frame. ORFX, where X is 1-11491 (see Table In the specification). ABN15762 to ABN2752 encode the human ORFX proteins are useful for proteins given in ABN15762 to ABN2752 encode the human ORFX reating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manifacture of a medicament for treating a syndrome associated with ORFX sequences can be used in Gene therapy. ORFX sequences can be used in Gene therapy. ORFX sequences can be used in Gene therapy. ORFX sequences can be used in the special carrier of standards in the sequences can be used in the sequences can be used in the treatment of cancer, hyperproliferative disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol eter storage disease, various immune disorders substanting and isorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune inflammatory eve disease. ORFX proteins are also useful for treating disorders, including from the purns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part directly from WIPO at fibrosic, introduces and electronic sequences are also sequences and electronic sequences and electronic sequences are dispersed to the printed specification, but was obtained 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; myasthenia gravis.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX corporation of treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, infribosis of liver, protective in the contains, benign tumours, keloid, degenerative disorders, hemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiorascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious disease, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease, autoimmune disorders such as multiple sclerosis, theumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune disorders such as multiple sclerosis, contains are also bene degenerating during, incisions, there in the prince of protection or regeneration and treatment of lung or liver fibrosis, protection or regeneration and treatment of lung or liver fibrosis, contains protein contains and conditions resulting from reperferion or regeneration stissues and conditions resulting from cyclokine damage. Na. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic contains and decomposity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                              Novel human polypeptides and polynuclectides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to identifying agents which alter the interaction between a protein tyrosine phosphatase (PTP) and a tyrosine phosphatase (PTP) and a tyrosine phosphatylated using fluorescence energy signals. The methods are useful for performing screening assay to identify agents that alter Prb binding to and PTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates. The present sequence is that of catalytic domain of a PTP for comparison with human PTPIB (AAG78262)
                                                                                                                                                                                                                                     The present invention provides substrate trapping mutant protein tyrosine phosphatases (PTPs). They can be used to reduce the activity of tyrosine phosphorylated proteins and to screen for modulators capable of altering the binding of protein tyrosine phosphatases to their substrate. These may be used in disease diagnosis and treatment
                                                                                                        New substrate trapping mutant protein tyrosine phosphatases (PTP) in which the wild type PTP catalytic domain invariant aspartate is replaced with an unphosphorylated amino acid, useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PTP; protein tyrosine phosphatase; tyrosine phosphorylated polypeptide; dephosphorylation; phosphotyrosine; human; PTP1B; mouse; fruit fly;

The polynucleotide of polynucleotide and the invention has antiproliferative, hepatotropic, nephrotropic, antiarthritic, antipsoliferative, hepatotropic, nephrotropic, antiarthritic, antipsoliferative, and cytostatic activity. The polynucleotide may have a use in gene therapy. A polynucleotide or polyneptide of the invention is useful for preventing, treating or ameliorating a medical condition, e.g. a proliferative disorder. They are also useful for treating e.g. liver disease, renal failure, immunological disorders including arthritis and psoriasis, cardiovascular disorders such as congenital heart defects and congestive heart failure, and condition or susceptibility to a condition in a subject. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antiproliferative, hepatotropic; nephrotropic; antiarthritic; antiprofiatic; cardiant; cytostatic; gene therapy, liver disease; proliferative disorder; renal failure; cardiovascular disorder; immunological disorder; antibritis; psoriasis; congenital heart defect; congestive heart failure; cancer; human; mouse; yeast; rat; fruitfly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present protein sequence is that of the cytoplasmic, Lymphoid Protein Tyrosine Phosphatase, Lyp2 protein that has a single catalytic domain. The non-catalytic portion of the phosphatase contains unique sequences, including a single Pars sequence rich in Pro, Glu or Asp, Ser and Thr. It is expressed significantly in fetal liver and in resting lymphoid cells. Lyp2 is an isoform of the Lyp1 gene that arises by alternative splicing of the mRNA. The intronic sequence of Lyp1 encodes for the C-terminal aminoacids and part of the 3'untranslated region of Lyp2. Lyp2 shares sequence identity with the murine phosphatase Z70PRP. Lyp proteins are important for requiation of T cell antigen and cytokine receptor has immunosuppressive activity. Compounds that increase expression of Lyp2 brotein can be used as immunosuppressive agents to reduce or prevent to brotein can be used as immunosuppressive agents to reduce or prevent cell activation or proliferation, to control thymocyte differentiation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid encoding intracellular tyrosine phosphatase and related proteins, used to modulate signaling through T cells, particularly as immunosuppressant.
                                                                                                                                                                                                                 Lymphoid Protein Tyrosine Phosphatase; Lyp protein; immunosuppressant; intracellular tyrosine phosphatase; PrPase; fetal liver; transplant; resting lymphoid cell; protein tyrosine kinase; PTKs; lymphocyte; T cell antigen receptor signalling; cytokine receptor signalling; autoimmune disease; intronic sequence; alternative mRNA splicing.

Sequence 7, Application US/09848294

Sequence 7, Application US/09848294

Patent No. 6479640

GENERAL INFORMATION:

APPLICANT: Tonks, Nicholas K.

TITLE OF INVENTION: Isolation of A cDNA Encoding A No. 6479640el

TITLE OF INVENTION: Protein Tyrosine Phosphotase Which Localizes to Forein Tyrosine Phosphotase Which Localizes to Forein Tyrosine Phosphotase Which Localizes to CURRENT OF INVENTION: Adhesions and Uses Therefor

TITLE OF INVENTION: Adhesions and Uses Therefor

TITLE OF INVENTION: Adhesions and Uses Therefor

FILE REFERENCE: CSH190-04FZA

CURRENT APPLICATION NUMBER: US/09/28,251

PRIOR FILING DATE: 1999-01-22

PRIOR PELING DATE: 1996-12-04

PRIOR APPLICATION NUMBER: 08/107,420

PRIOR APPLICATION NUMBER: 08/107,420

PRIOR APPLICATION NUMBER: 07/663,579

PRIOR APPLICATION NUMBER: 07/663,579

PRIOR APPLICATION NUMBER: 07/643,579

PRIOR APPLICATION NUMBER: 07/494,036

PRIOR FILING DATE: 1991-03-01

PRIOR PRIOR APPLICATION NUMBER: 07/494,036

PRIOR FILING DATE: 1990-03-14

NUMBER OF SEQ ID NOS: 13

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

S50578
hypothetical protein YER075c - yeast (Saccharomyces cerevisiae)
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Date: 28-May-1993 #sequence_revision 24-Feb-1995 #text_change 23-Mar-2001
C;Accession: S50578
R;Dietrich, F.S.
submitted to the EMBL Data Library, December 1994
A;Description: The sequence of S. cerevisiae lambda clone 3612 and cosmid 9747.
A;Reference number: S50438
A;Molecule type: DNA
A;Residues: 1-928 <DIE>
A;Molecule type: DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                kinase FUS3.
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                                                                                                                                                                 tyrosine + phosphate.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
SEQUENCE FROM N.A.

Hughes B., Pohl T.M.;

Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: May be implicated in the ubiquitin-mediated protein degradation pathway. May be involved in the regulation of MAP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tyrosine + phosphate.
-!- SUBGELIULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Spleen, thymus, lympH node and bone marrow.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
                                                                                                                                                                                                                                                                                Eukaryotan, Mehazia, Chordata, Craniata, Vertebrata, Buteleostomi, Mammalia, Buthazia, Rodentia, Sciurognathi, Muridae, Murinae, Mus. Yu M., Chen S., Mao M., Chen Z.;

Submitted (JUL-1998) to the EMBL/GenBank/DBJ databases.

-!- FUNCTION: Seems to act on Cbl. May play a role in regulating the
function of Cbl and its associated protein kinases.

-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein
                                                                                                                                                                                                                                                                                                                                                                                                                          tyrosine + phosphate.
-! SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein tyrosine + phosphate + CATALYTIC ACTIVITY: Protein tyrosine + phosphates + COATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
-!- SIMILARITY: Contains 1 FERM domain.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.

"The nucleotide sequence of Saccharomyces cerevisiae chromosome V.";

Nature 387:78-81(1997).

-! FUNCTION: Major phosphatese responsible for tyrosine dephosphorylation of MaP kinase FUS3 to inactivate its activity; it also has important roles, along with MSG5, in the inactivation of FUS3 following pheromone stimulation.

-! CATALVITY: Palongs pheromone stimulation.

-! CATALVITY: Balongs to the protein-tyrosine phosphate + H(2)O = protein tyrosine + phosphate.

-! SIMILARTIY: Balongs to the protein-tyrosine phosphatase family.

-! SIMILARTIY: Contains 1 rhodanese domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TYNE_HUMAN

Blochem. Bloches. Eds. Commun. 209:959-965(1995).

-!-CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate.

-!-TISSUB SPECIFICITY: Expressed in a variety of human tissues including kidney, skeletal muscle, lung and placenta.

-!-SIMILARITY: Contains I FERM domain.

-!-SIMILARITY: Contains to the protein-tyrosine phosphatase family.

Non-receptor class subfamily. TISSUE=Breast carcinoma; MEDLINE=92251727; PubMed=7733990; MEDLINE=92251727; PubMed=7733990; Smith A.L., Mitchell P.J., Shipley J., Gusterson B.A., Rogers M.V., Crompton M.R.; Crompton M.R.; a novel human cDNA encoding protein tyrosine phosphatase- and (BY SIMILARITY) POLY-PRO. "Chromosomal localization of the protein tyrosine phosphatase G1 gene "Chromosomal localization of the aberrant transcripts in human colon cancer cells.";
FEBS Lett. 339:1222-228 (1994).
-!- CATALYTIC ACITVITY: Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate.
-!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- DISEASE: DEFECTS IN PTPN12 ARE FOUND IN SOME COLON CANCERS.
-!- SIMILARITY: Belongs to the protein-tyrosine phosphatase family.
Non-receptor class subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

Isoldablobase in the state of the state of pancreatic lesses of pancreas and brain.

-1-TISSUE SPECIFICITY: Pancreas and brain.
-1-DEVELOPMENTAL STRAGE: Expressed in day 8.5 embryos (EB.5) in the development. First expressed in day 8.5 embryos (EB.5) in the dorsal part of the midgut endoderm and by E9.5, in the pancreatic rudiment specifically in early endocrine progenitor cells. It later stages expressed in insulin- or glucagon-producing cells. During neural development, the type 2 PTP-NP is expressed in early stages of neurogenesis, and the type 1 weakly in the later stages.
-1-PTM: Appears to undergo multiple proteolytic cleavage at consecutive basic residues (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CYTOPIASNIC (POTENTIAL).
PROTEIN-TYROSINE PHOSPHATASE.
PHOSPHOCYSTEINE INTERMEDIATE (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1997 (Rel. 35, Created)

Sheppard P., Kindsvogel W., Hagopian W.A.;

"An islet-cell protein tyrosine phosphatese is a likely precursor to the 37-kba autoantigen in type I diabetes: human and macaque predictive autoantibodies.";

Mol. Med. 3:163-1731(1997).

-!- FUNCTION: Implicated in development of nervous system and pancreatic endocrine cells.

-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
Receptor-type protein-tyrosine phosphatase N2 precursor (EC 3.1.3.48) (R-PTP-N2) (M1851).
                                                                                                                                                                                                                                                                                                                                                                         tyrosine + phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Probable).
-!- TISSUE SPECIFICITY: Brain, prostate, pancreatic islets. Lower expression in spinal cord, thyroid, adrenal medulla and gastrointestinal tract.
                                                  Macaca nemestrina (Pig-tailed macaque).

Fitzgerald L.R., Walton K.M., Dixon J.E., Largent B.L.;
Submitted (Nov-1996) to the EMBL/GenBank/DBJ databases.
-!- FUNCTION: Implicated in development of nervous system and
pancreatic endocrine cells.
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
-!- tyrosine + phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Probable).
-!- TISSUE SPECIFICITY: Pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                           -i- PTM: Appears to undergo multiple proteolytic cleavage at consecutive basic residues (By similarity).
-i- SIMILARITY: Contains 1 protein-tyrosine phosphatase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RECEPTOR-TYPE PROTEIN-TYROSINE PHOSPHATASE N2. EXTRACELLULAR (POTENTIAL).

       Note=No experimental confirmation available:
-!- TISSUE SPECIFICITY: Highest levels in brain and pancreas.
-!- DOMAIN: The cytoplasmic domain appears to contain the autoantigenic epitopes.
-!- PTM: Appears to undergo multiple proteolytic cleavage at consecutive basic residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PHOSPHOCYSTEINE INTERMEDIATE (BY
